Key to codes:-

H	Organic soil layer dominated by organic material formed from accumulations of undecomposed or partially decomposed organic material at the soil surface, which may be under water.
O	Organic soil horizon layer dominated by organic material consisting of undecomposed or partially decomposed organic litter, such as leaves, needles, twigs, moss, and lichens that has accumulated on the surface; they may be on top of either mineral or organic soils.
A	Surface mineral soil layer (usually rich in humified plant organic matter and dark in color)
AB	Transitional mineral soil layer immediately below the surface layer with dominant features resembling the A horizon
BA	Similar to AB, but B Horizon features dominating
B	Subsuface mineral soil layer, substantially altered in color, and well-formed structure
C	Subsurface mineral or/and organic soil material forming the parent materials of the soil (may comprise decayed and weathering geological rock materials- *saprolite*, alluvium or other depositions from which soil materials would have derived origin)
BD	Bulk Density of the soil
Texture Codes	S=sand; LS=loamy sand; SL=sandy loam; SCL=sandy clay loam; SC=sandy clay; C=clay; HC=heavy clay; Cl=clay loam; SiCl=silty clay loam; SiC=silty clay
